

Gas scaling relations at $z = 0.1$ — literature + DPM + calibrated model
 Calibrated ($\beta_n, \beta_p = \text{fit_comparat2025 S1 MAP}$): $\beta_n = 0.244$, $\beta_p = 0.893$, $n_{e,0.3} = 3.7e-05 \text{ cm}^{-3}$, $T > 0.3 \text{ keV}$
 DPM m.2 defaults give $\alpha_{L_X} = 1.97$, $\alpha_{kT} = 0.49$; fitted slopes give $\alpha_{L_X} = 1.81$, $\alpha_{kT} = 0.65$

L_X - M_{500c} at $z = 0.1$ (integrated to R_{500c})

Emission-weighted T vs M_{500c} at $z = 0.1$

tSZ signal $Y \cdot D_A^2$ vs M_{500c} at $z = 0.1$

L_X - kT at $z = 0.1$
